Networking 101

Maël Auzias

ENSIBS - UBS

September 2015

Figure: teaching.auzias.net

Course details

Objectives

- ► How do *computers* communicate?
- What are the mechanisms under an HTTP request or a telegram message?
- Networks are all around us, better study them!

Course details

Evaluation

- Short test at the end of each lesson
- Project
- ► Final exam (1 hour)
- ► All equal weighting

Material

Slides available at teaching.auzias.net (github too)

Presentation Outline

Introduction

Physical

Data Link

Network

Transport

- Network: an interconnected group or system
- ► Internet: world wide interconnected system of networks RFC791 (September 1981)
- ▶ **IP:** Internet **Protocol** provides the functions necessary to deliver a package of bits from a source to a destination over a network
- (world wide) Web: network consisting of a collection of Internet websites using HTTP

- HTTP: Hypertext Transfer Protocol, application-level protocol for distributed, collaborative, hypermedia information systems draft HTTP2 (July 2014)
- ► FTP: File Transfer Protocol promotes sharing of files, encourages the use of remote computers RFC959 (October 1985)
- ▶ RFC: Request For Comments (Internet Draft (ID), RFC, Internet Standard)

- Router: network hardware providing routing services
- Routing: algorithm processed to decide where to forward a packet
- ► Forwarding: action of moving a packet from one NIC to another
- ▶ NIC: Network Interface Card
- ► **Switch (hub):** network **hardware** connecting systems using packet switching
- ► Packet switching: forward-like method regardless of the content (destination-based)
- ▶ NAT: Network Address Translation, router modifying IP address into another IP address (PAT).

- ► Node (network): any entity that can send packets to/receive packets from a network through a NIC
- ▶ Client: computer able to send requests to a server
- ▶ **Request: application message** destined for a server (*order*)
- ▶ **Server: computer** able to respond to a client's requests
- Response: application message destined for a client (result)
- ► Fat client: application where most functions are processed by the client itself
- ► Thin client: application where most functions are carried out on a central server

Network classification

- BAN: Body Area Network
- ► PAN: Personal Area Network
- ► (W)LAN: (Wireless) Local Area Network (home, office, school or airport)
- ▶ MAN: Metropolitan Area Network, can cover a whole city
- ► WAN: Wide Area Network cover a broad area (Internet)

Topologies

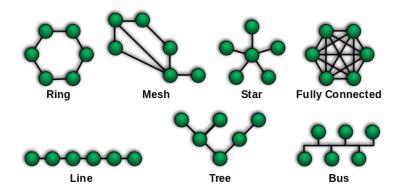

Figure: upload.wikimedia.org

Topologies

- Point-to-point: two entities directly connected to each other (tunnel).
- ▶ **Ring:** data go around the ring, unidirectional way network.
- ▶ **Mesh:** all nodes cooperate in the distribution of data in the network¹.
- ▶ **Star:** all messages go through the same central node, reducing network failure.
- ► Fully connected: all nodes are connected to all other nodes.
- ▶ Line: bidirectional link between two nodes. Node can only send packet going through its neighbors.
- ▶ **Bus:** all nodes are connected to the same media. Only one can send a packet at a time, which all others then receive.
- ▶ **Tree:** hierarchical topology, such as a binary tree.

¹Hong Kong protesters used a mesh network to organize (2014)

Presentation Outline

Introduction

Physical

Data Link

Network

Transport

Aims

- Interface data link layer,
- ► (De)Encode,
- ► Transmit: 1 after 0 (after 0 or 1, after 0... or 1)

Hardware medium

- ► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s
- ► IEEE 802.11 (a.k.a. Wi-Fi): <50 Mbit/s (802.11ad goes up to 6.75 Gbit/s)
- ► IEEE 802.15.1 (a.k.a. Bluetooth): <1 Mbit/s
- ► IEEE 802.15.4 (a.k.a. ZigBee): <250 kbit/s
- ► IEEE 802.16 (a.k.a. Wi-Max): <40 Mbit/s
- ▶ IEEE 1394 (a.k.a. Firewire): <3200 Mbit/s
- ▶ USB, serial port such as RS-232...

Hardware medium: IEEE 802.3 (Ethernet)

Figure: RJ45 connector

Hardware medium: IEEE 802.15.1 (Bluetooth)

Figure: Bluetooth card

Hardware medium: IEEE 802.15.4 (ZigBee)

Figure: ZigBee card

Hardware medium: IEEE 802.16 (Wi-Max)

Figure: Wi-Max antenna

Hardware medium: IEEE 1394 (Firewire)

Figure: Firewire connector

Encoding

- ► MLT3 (Multi-Level Transmit): state changes for 1s over 3 levels, stays in the same state for 0s
- ► AMI (Alternate Mark Inversion): state 0 for 0s, state +/-1 for 1s
- ► Manchester: voltage transition (rising/falling edge mean 1/0)
- ▶ BMC (Biphase Mark Code): change its state for 1s, stay on the same state for 0s
- and so on...

Encoding: Multi-Level Transmit

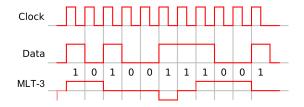

Figure: Multi-Level Transmit

Encoding: Alternate Mark Inversion

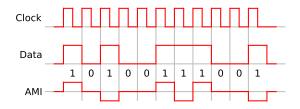

Figure: Alternate Mark Inversion

Encoding: Manchester

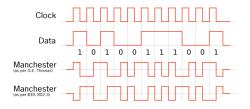

Figure: Manchester

Encoding: Biphase Mark Code

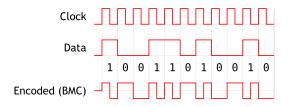

Figure: Biphase Mark Code

Transmitting

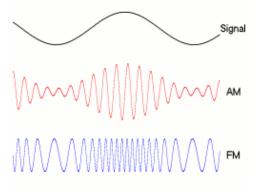

Figure: Amplitude and phase modulation

Error detection

- Repetition (hum...)
- Parity (XOR)
- Checksum
- ▶ CRC (Cyclic redundancy check): with a polynomial divison
- Hash
- ▶ and so on...

Error correcting

- ► Repetition (again)
- Hamming
- ► MDPC (Multidimensional parity-check code)

Correction: MDPC

Raw data to send: 0x01 02 03 04

Figure: Data received with MDPC

Data sent (with MDPC): 0x01 02 03 03 04 07 04 06

Presentation Outline

Introduction

Physical

Data Link

Network

Transport

Aims

- Interface network layer,
- ▶ Delivery to unique(?) hardware addresses,
- Framing,
- Data transfer

Layer composition (of its two sublayers)

- 1. Logical Link Control (LLC):
 - end to end flow control
 - end to end error control
 - (transmitting/receiving) protocols, over MAC sublayer, multiplexing
- 2. Media Access Control (MAC):
 - physical (hardware) addressing
 - collision detection and retransmission
 - data packet scheduling (and queuing)
 - QoS
 - VLAN

Carrier Sense Multiple Access with Collision Avoidance

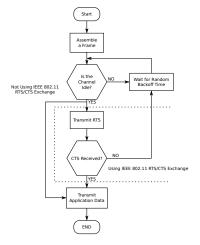

Figure: CSMA CA

Layer 2 Ethernet packet

MAC dest. (6)	MAC src. (6)	VLAN tag* (4)	Ethertype (2)
Payload (42-1500)		Frame check sequence (4)

Presentation Outline

Introduction

Physical

Data Link

Network

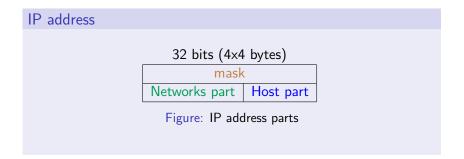

Transport

Aims

- ▶ Interface transport layer,
- Host addressing,
- End-to-end packet transmission (data link? Connectionless? Switch? Router?),
- Routing, load balancing

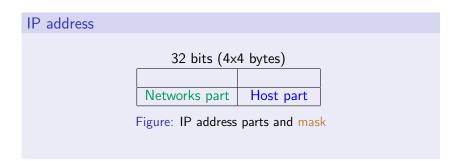

Concepts

- ▶ IP addressing fundamentals,
- Classfull IP addressing,
- Subnet and VLSM (Variable length subnet masks),
- CIDR (Classless inter-domain routing),
- Routing,
- ► IPv6.

Masks

- Separates network and host bits,
- ► MSB are always ones and then zeros! 255.254.255.0 is not possible,
- ▶ Indicates how many bits are used for the network part:
 - A 8-bit mask leaves 24 bits for the hosts,
 - ► A 16-bit mask leaves 16 bits for the hosts,
 - ► A 24-bit mask leaves 8 bits for the hosts,
 - ► A N-bit mask leaves 32-N bits for the hosts.
- Two different masks (differences seen further on):
 - Network mask,
 - Subnet mask.

IP address

32 bits (4x4 bytes)

ones mask	zeros mask	
Networks part	Host part	

Figure: IP address parts and mask

Is that an address?

- ► Network address,
- Hosts,
- Broadcast address.

Within the same network

- All addresses have the same network bits,
- ► Network address has zeros for host bits: x.x.x.0*,
- ► All hosts have different host bits: x.x.x.[0-1]*,
- ▶ Broadcast address has ones for host bits: x.x.x.1*.

Mask /24	255	255	255	0
254 hosts	11111111	11111111	11111111	00000000
Network address	192	168	1	0
	11000000	10101000	0000001	00000000
First host	192	168	1	1
	11000000	10101000	0000001	00000001
Last host	192	168	1	254
	11000000	10101000	0000001	11111110
Broadcast address	192	168	1	255
	11000000	10101000	0000001	11111111

Figure: IP address example 1

Mask /16	255	255	0	0
65.534 hosts	11111111	11111111	00000000	00000000
Network address	172	64	0	0
	10101100	01000000	00000000	00000000
First host	172	64	0	1
	10101100	01000000	00000000	00000001
Last host	172	64	255	254
	10101100	01000000	11111111	11111110
Broadcast address	172	64	255	255
	10101100	01000000	11111111	11111111

Figure: IP address example 2

Formula: how many hosts with an N-bit mask?

 $2^{32-N}-2$, the -2 moves out network and broadcast addresses which are not hosts.

- ▶ 24-bit mask: $2^{32-24} 2 = 2^8 2 = 254$ hosts
- ▶ 16-bit mask: $2^{32-16} 2 = 2^{16} 2 = 65.534$ hosts
- ▶ 8-bit mask: $2^{32-8} 2 = 2^{24} 2 = 16.777.214$ hosts

Public addresses

- Most IP addresses
- Registered ISP and large organizations inherit blocks of public addresses from IANA⁶
- Usage of unregistered public addresses is forbidden.

Private addresses

- Privates addresses are A, B and C classes (not all, see after)
- No registration needed
- Not routed across the Internet
- ▶ Proxy, NAT and private addresses solved IPv4 shortage.

Class	А	В	С
First octet	1 - 126	128 - 191	192 - 223
First octet 0b	0*	10*	110*
Network mask	255.0.0.0	255.255.0.0	255.255.255.0
	/8	/16	/24
IP addresses range	1.0.0.0	128.0.0.0	192.0.0.0
	126.0.0.0	191.255.0.0	223.255.255.0
Private range	10.0.0.0	172.16.0.0	192.168.0.0
	10.255.255.255	172.31.255.255	192.168.255.0
Number of hosts	16.777.214	65.534	254

Figure: Three main classes

Where did 127.0.0.0/8 go ?!

Class D

- ► First octet: 224 239
- ► First octet pattern: 1110*
- These IP addresses are multicast addresses.

Class E

- Everything left
- Experimental class.

Reserved addresses

- ▶ 0.0.0.0 used in routing (seen further)
- ► 127.0.0.0/8: loopback addresses (127.0.0.1 127.255.255.254).

- ▶ Class A (16 m-addresses) and B (65 k-adresses) are too large!
- ► Class C (254 addresses) is manageable. A and B are not, and then not fully utilized... That's a waste of IP addresses!

Three means to limit the number of nodes on a network (regardless of the class) and, thus, improve manageability:

- Subnet,
- VLSM (Variable Length Subnet Mask),
- CIDR (Classless Inter-Domain Routing).

Subnet and VLSM

- ► Class A (16 m-addresses) and B (65 k-adresses) are too large!
- ► Class C (254 addresses) is manageable. A and B are not, and then not fully utilized... That's a waste of IP addresses!

Mask /16	255	255	0	0
65.534 hosts	11111111	11111111	00000000	00000000

CIDR

Classless Inter-domain Routing?

▶ Wait! What is routing?

Algorithms are processed to decide where to forward a packet

Any router must

- know where any packet should be directed
- send directly the packets to the destination if the router and the destination are on the same (sub)network

Any node

- on any network can communicate directly with all the nodes within the same network
- can connect to any node using its gateway
- needs to be aware of its gateway to communicate with nodes on other networks

Route

- Destination
- Gateway (next hop)
- Masks
- Metric
- Interface

```
>sudo route -n
Kernel IP routing table
Destination
                Gateway
                                 Genmask
                                                  Flags Metric Ref
                                                                       Use Iface
                 192.168.0.254
0.0.0.0
                                 0.0.0.0
                                                  UG
                                                                         0 eth0
192.168.0.0
                0.0.0.0
                                 255.255.255.0
                                                                          0 eth0
```

Figure: Routing table

```
>sudo route -n
Kernel IP routing table
                                                  Flags Metric Ref
Destination
                Gateway
                                 Genmask
                                                                       Use Iface
                192.168.0.254
0.0.0.0
                                 0.0.0.0
                                                  UG
                                                                         0 eth0
192.168.0.0
                0.0.0.0
                                 255.255.255.0
                                                                         0 eth0
```

Figure: Routing table

0.0.0.0?

- Default destination
- Default (sub)network(s)
- Default route
- ► Default gateway

Example

what would the routing table of this router look like?

Static or dynamic?

We will see this later

CIDR

Combine 2+ networks' into one bigger to ease routing.

Classless Inter-domain Routing?

- Can a routing table having both (192.168.0.0/24, E0), (192.168.1.0/24, E0), (10.0.0.0/8, S0) be shorten?
- ► Can a routing table having both (192.168.0.0/24, E0), (192.168.1.0/24, E0), (192.168.8.0/24, E0), (10.0.0.0/8, S0) be shorten?
- ► Can a routing table having both (192.168.0.0/24, E0), (192.168.4.0/24, E0), (192.168.1.0/24, E1), (10.0.0.0/8, S0) be shorten?

- RIP: Routing Information Protocol
- OSPF: Open Shortest Path First
- ► EIGRP: Enhanced Interior Gateway Routing Protocol

RIP_{v1}

- Classful routing
- ▶ Periodic updates (30 sec) ..
- ..by broadcasting (!)
- ▶ Metric is hop-count (max = 15, infinite = 16)
- ► Timer (180 sec) to tag route as invalid (metric = 16)
- no subnet, no VLSM, no CIDR, no router authentication

RIP v2

- Classless routing
- Multicast (224.0.0.9)
- VLSM support
- Route summarization
- "Authentication" (MD5)

RIPng is the next RIP version for support of IPv6

- 1. Router coming online broadcasts Request message
- 2. RIP Routers send **broadcasts** Response messages with their routing table
- 3. When Update timers (from other routers) expire, its routing table is sent again
- 4. When Invalid timer expires, the metric of the route is set to 16 (unreachable)
- 5. When Flush timer expires, the 16-metric routes are removed from the routing table
- 6. When a new router (or new metric) is sent, a Hold-down timer is started to stabilize the network.

⁷not always the whole table

OSPF

- Classless
- ▶ IPv4 and IPv6
- VSLM
- ▶ CIDR
- Build a topology of the network
- Dijkstra
- Metric = f(hop-count, bandwidth, link reliability)
- Subdivided into area (a 32-bit number)
- Multicast
- Authentication support (update only from trusted routers)

EIGRP

- Enhanced IGRP (to support classless routing)
- ▶ IPv4 and IPv6
- VSLM
- ▶ CIDR
- Build a topology of the network
- Dijkstra
- Metric = f(bandwidth, load, delay, reliability)
- Authentication support

IPv6 - Aims

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster
- Better security
- Better real-time QoS
- Better multicast diffusion (scope)
- ▶ Able to move without changing IP address
- ▶ Give the protocol the ability to evolve
- Give the protocol the ability to coexist with newer version

IPv4 vs IPv6

- not compatible
- ▶ IPv4 address: 4 octets, IPv6: 16 octets $(2^{128} = 3 \times 10^{138})$
- Packet Header, IPv6: 7 fields, IPv4:13 (faster to process)
- ▶ IP options: some required options are now optional (faster to process)
- Notation:
 - 8000:0000:0000:0000:0123:4567:89AB:CDEF
 - 8000::0123:4567:89AB:CDEF
 - ::192.168.2.3
- Unicast address format:

bits	48 (or more)	16 (or fewer)	64
field	routing prefix	subnet id	interface identifier

Figure: Unicast IPv6 address format

IPv4 vs IPv6

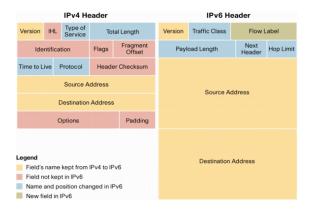

Figure: IPv4 and IPv6 headers (www.cisco.com)

IPv6 - Header

- Version (4 bits): 0b0110
- ► Traffic class (8 bits): 6-MSB for differentiated services⁸, 2-LSB for ECN⁹
- ► Flow label (20 bits): routers are supposed to use the same path for the same flow (thus, destination do not need to re-order packets)
- Payload length (16 bits): packet length minus its header length

⁸multimedia or http

⁹Explicit Congestion Notification (RFC 3168)

IPv6 - Header

- ▶ Next header (8 bits): specifies the transport layer protocol, also indicates (if any) extension header that follows.
- ► **Hop limit (8 bits):** Hop count (discussion was to use a duration instead, but router implementations would be much more complex)

Optional IPv6 headers offer the possibility to

- specify the route of the datagram
- include authentication data
- include fragmentation parameters
- and so on...

IPv6 - Anecdotes

- IPv6 address length could have been 8 bytes, or 20 bytes, or even variable
- ► Hop count max value (255) is considered, by some, not enough
- ► Removing IPv4 checksum is as safe as removing brakes from a car
- Different national laws on encryption disallow a real secure transport layer

IPv6 - Adoption

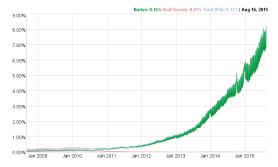

Figure: IPv6 adoption (among Google users)¹⁰

- ▶ **2014** Belgium: 28%, USA and Germany: 11%
- ▶ **2015** Belgium: 36%, USA: 21% and Germany: 18%

 $^{^{10}} https://www.google.com/intl/en/ipv6/statistics.html \\$

Presentation Outline

Introduction

Physical

Data Link

Network

Transport

Aims

- Interface session layer,
- ▶ Reliable end-to-end communication,
- Order and reassemble received packets (if needed),
- Flow control,
- Congestion avoidance (if supported by protocol),
- Multiplexing

Application identification

Socket address

- Node identification is made by IP address,
- ▶ Application identification is made by node identification...
- ... and a port. Number between 0 and 65535. (1-1024: root privilege)
 - ▶ ip.ad.dr.ess:port

Port	Protocol
21	FTP
22	SSH
23	Telnet
25	SMTP
80	HTTP
443	HTTPS
465	SMTPS
631	IPP
1194	OpenVPN
3128, 8080	Web Proxy
9418	git
23399	Skype

Figure: Default port for well known protocol

TCP header

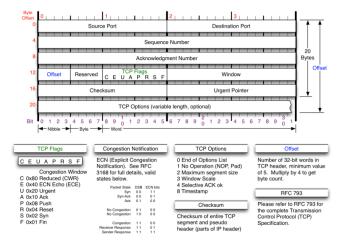

Figure: nmap.org: TCP header

UDP header

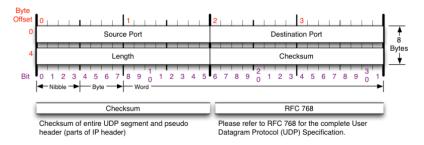

Figure: nmap.org: UDP header

Socket Primitives (TCP)

Order	Primitive	Meaning
1	SOCKET	Creates a new communication endpoint
2	BIND	Links local IP address to the socket (for server)
3	LISTEN	Signs up for incoming connections
4	ACCEPT	Blocking call till a connection attempt occurs
-	CONNECT	Tries to connect to another communication endpoint
-	SEND	Sends data through the established connection
-	RECEIVE	Receives data through the established connection
last	CLOSE	Releases the connection (do not mistake shutdown and close.)

Figure: TCP primitives

A socket does not have an IP address until it is bound, just an allocation in the transport entity. A server must listen before any client can connect.

close() a socket does not send the closing stream three handshake, shutdown() does. fork() is needed, poll() and select() can be used too.

What are these ?

- ▶ **Frame**: Physical layer representation
- ▶ Datagram: UDP¹¹ or IP packet (IP datagram, UDP datagram)
- ▶ **Segment**: TCP data unit
- ▶ **PDU**: Protocol Data Unit, generic term.
- ► Fragment: Any data unit fragmented

¹¹User **Datagram** Protocol

I hope you liked it and learnt something new!

 $Figure:\ teaching.auzias.net$
