#### **Network Computing courses**

Maël Auzias

ENSIBS - UBS

October 2014

Figure: teaching.auzias.net

#### Course details

#### **Objectives**

- ► How do *computers* communicate?
- What are the mechanisms under an HTTP request or a telegram message?
- ► Networks are all around us, better study them!

#### Course details

#### **Evaluation**

- Short test at the beginning of every lesson (5 min)?
- Project
- ► Final exam (1 hour)
- ► All same weighting

#### Material

► Slides available at teaching.auzias.net (github too)

#### Presentation Outline

Introduction

Physical

Data Link

Network

Transport

▶ Network: an interconnected group or system

- ▶ **Network:** an **interconnected** group or system
- ► Internet: world wide interconnected system of networks RFC791 (September 1981)

- ▶ **Network:** an **interconnected** group or system
- ► Internet: world wide interconnected system of networks RFC791 (September 1981)
- ▶ **IP:** Internet **Protocol** provides the functions necessary to deliver a package of bits from a source to a destination over a network

- ▶ **Network:** an **interconnected** group or system
- ► Internet: world wide interconnected system of networks RFC791 (September 1981)
- ▶ **IP:** Internet **Protocol** provides the functions necessary to deliver a package of bits from a source to a destination over a network
- (world wide) Web: network consisting of a collection of Internet websites using HTTP

► **HTTP:** Hypertext Transfer **Protocol**, application-level protocol for distributed, collaborative, hypermedia information systems draft HTTP2 (July 2014)

- HTTP: Hypertext Transfer Protocol, application-level protocol for distributed, collaborative, hypermedia information systems draft HTTP2 (July 2014)
- ► FTP: File Transfer Protocol promotes sharing of files, encourages the use of remote computers RFC959 (October 1985)

- ► **HTTP:** Hypertext Transfer **Protocol**, application-level protocol for distributed, collaborative, hypermedia information systems draft HTTP2 (July 2014)
- ► FTP: File Transfer Protocol promotes sharing of files, encourages the use of remote computers RFC959 (October 1985)
- ► TCP: Transmission Control Protocol is intended for use as a highly reliable host-to-host RFC761 (January 1980)

- ► **HTTP:** Hypertext Transfer **Protocol**, application-level protocol for distributed, collaborative, hypermedia information systems draft HTTP2 (July 2014)
- ► FTP: File Transfer Protocol promotes sharing of files, encourages the use of remote computers RFC959 (October 1985)
- ► TCP: Transmission Control Protocol is intended for use as a highly reliable host-to-host RFC761 (January 1980)
- ▶ **UDP:** User Datagram **Protocol** provides a procedure for application programs to send messages to other programs with a minimum of protocol mechanism RFC768 (August 1980)

- ► **HTTP:** Hypertext Transfer **Protocol**, application-level protocol for distributed, collaborative, hypermedia information systems draft HTTP2 (July 2014)
- ► FTP: File Transfer Protocol promotes sharing of files, encourages the use of remote computers RFC959 (October 1985)
- TCP: Transmission Control Protocol is intended for use as a highly reliable host-to-host RFC761 (January 1980)
- ▶ **UDP:** User Datagram **Protocol** provides a procedure for application programs to send messages to other programs with a minimum of protocol mechanism RFC768 (August 1980)
- ▶ RFC: Request For Comments (Internet Draft (ID), RFC, Internet Standard)

▶ Router: network hardware providing routing services

- ▶ Router: network hardware providing routing services
- Routing: algorithm processed to decide where to forward a packet

- Router: network hardware providing routing services
- Routing: algorithm processed to decide where to forward a packet
- ► Forwarding: action of moving a packet from one NIC to another

- Router: network hardware providing routing services
- Routing: algorithm processed to decide where to forward a packet
- ► Forwarding: action of moving a packet from one NIC to another
- ▶ NIC: Network Interface Card
- Switch (hub): network hardware connecting systems using packet switching

- Router: network hardware providing routing services
- Routing: algorithm processed to decide where to forward a packet
- ► Forwarding: action of moving a packet from one NIC to another
- ▶ NIC: Network Interface Card
- Switch (hub): network hardware connecting systems using packet switching
- ► Packet switching: forward-like method regardless of the content (destination-based)

- Router: network hardware providing routing services
- Routing: algorithm processed to decide where to forward a packet
- ► Forwarding: action of moving a packet from one NIC to another
- NIC: Network Interface Card
- Switch (hub): network hardware connecting systems using packet switching
- ► Packet switching: forward-like method regardless of the content (destination-based)
- ► NAT: Network Address Translation, router modifying IP address into another IP address.

▶ Node (network): any entity that can send packets to/receive packets from a network through a NIC

- ▶ Node (network): any entity that can send packets to/receive packets from a network through a NIC
- ▶ Client: computer able to send requests to a server

- ► Node (network): any entity that can send packets to/receive packets from a network through a NIC
- ▶ Client: computer able to send requests to a server
- ▶ Request: application message destined for a server (order)

- ► Node (network): any entity that can send packets to/receive packets from a network through a NIC
- ▶ Client: computer able to send requests to a server
- ▶ Request: application message destined for a server (order)
- ▶ **Server: computer** able to respond a client's requests

- ► Node (network): any entity that can send packets to/receive packets from a network through a NIC
- ▶ Client: computer able to send requests to a server
- ► Request: application message destined for a server (order)
- ▶ **Server: computer** able to respond a client's requests
- ▶ Response: application message destined for a client (result)

- ► Node (network): any entity that can send packets to/receive packets from a network through a NIC
- ▶ Client: computer able to send requests to a server
- ▶ Request: application message destined for a server (order)
- ▶ **Server: computer** able to respond a client's requests
- ► **Response:** application message destined for a client (result)
- Fat client: application where most functions are processed by the client itself

- ► Node (network): any entity that can send packets to/receive packets from a network through a NIC
- ▶ Client: computer able to send requests to a server
- ▶ Request: application message destined for a server (order)
- ▶ **Server: computer** able to respond a client's requests
- ► **Response:** application message destined for a client (result)
- ► Fat client: application where most functions are processed by the client itself
- ► Thin client: application where most functions are carried out on a central server

▶ **BAN:** Body Area Network

► **BAN:** Body Area Network

▶ PAN: Personal Area Networks

- ► BAN: Body Area Network
- ▶ PAN: Personal Area Networks
- ► (W)LAN: (Wireless) Local Area Networks (home, office, school or airport)

- ► **BAN:** Body Area Network
- ▶ PAN: Personal Area Networks
- ► (W)LAN: (Wireless) Local Area Networks (home, office, school or airport)
- ▶ MAN: Metropolitan Area Networks, can cover a whole city

- BAN: Body Area Network
- ▶ PAN: Personal Area Networks
- ► (W)LAN: (Wireless) Local Area Networks (home, office, school or airport)
- ▶ MAN: Metropolitan Area Networks, can cover a whole city
- ► WAN: Wide Area Networks cover a broad area (Internet)

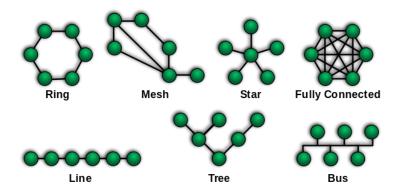

Figure: upload.wikimedia.org

► **Point-to-point:** two entities directly connected to each other (tunnel).

¹Hong Kong protesters use a mesh network to organize (♂) (毫) (毫) (②)

- Point-to-point: two entities directly connected to each other (tunnel).
- ▶ Ring: data go around the ring, unidirectional way network.

- Point-to-point: two entities directly connected to each other (tunnel).
- ▶ Ring: data go around the ring, unidirectional way network.
- ► **Mesh:** all nodes cooperate in the distribution of data in the network<sup>1</sup>.

- Point-to-point: two entities directly connected to each other (tunnel).
- ▶ **Ring:** data go around the ring, unidirectional way network.
- ► Mesh: all nodes cooperate in the distribution of data in the network<sup>1</sup>.
- ► **Star:** all messages go through the same central node, reducing network failure.

- Point-to-point: two entities directly connected to each other (tunnel).
- Ring: data go around the ring, unidirectional way network.
- ► Mesh: all nodes cooperate in the distribution of data in the network<sup>1</sup>.
- ▶ **Star:** all messages go through the same central node, reducing network failure.
- ▶ Fully connected: all nodes are connected to all other nodes.

- Point-to-point: two entities directly connected to each other (tunnel).
- ▶ **Ring:** data go around the ring, unidirectional way network.
- Mesh: all nodes cooperate in the distribution of data in the network<sup>1</sup>.
- Star: all messages go through the same central node, reducing network failure.
- ► Fully connected: all nodes are connected to all other nodes.
- ▶ Line: bidirectional link between two nodes. Node can only send packet going through its neighbors.

- Point-to-point: two entities directly connected to each other (tunnel).
- ▶ **Ring:** data go around the ring, unidirectional way network.
- Mesh: all nodes cooperate in the distribution of data in the network<sup>1</sup>.
- ► **Star:** all messages go through the same central node, reducing network failure.
- Fully connected: all nodes are connected to all other nodes.
- ▶ Line: bidirectional link between two nodes. Node can only send packet going through its neighbors.
- ▶ **Bus:** all nodes are connected to the same media. Only one can send a packet at a time, which all others then receive.

- Point-to-point: two entities directly connected to each other (tunnel).

Network

Transport

### Aims

Interface data link layer,

### **Aims**

- Interface data link layer,
- ► (De)Encode,

#### **Aims**

- ▶ Interface data link layer,
- ► (De)Encode,
- ► Transmit: 1 after 0 (after 0 or 1, after 0... or 1)

► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s

- ► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s
- ► IEEE 802.11 (a.k.a. Wi-Fi): <50 Mbit/s (802.11ad goes up to 6.75 Gbit/s)

- ► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s
- ► IEEE 802.11 (a.k.a. Wi-Fi): <50 Mbit/s (802.11ad goes up to 6.75 Gbit/s)
- ▶ IEEE 802.15.1 (a.k.a. Bluetooth): <1 Mbit/s

- ► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s
- ► IEEE 802.11 (a.k.a. Wi-Fi): <50 Mbit/s (802.11ad goes up to 6.75 Gbit/s)
- ▶ IEEE 802.15.1 (a.k.a. Bluetooth): <1 Mbit/s
- ► IEEE 802.15.4 (a.k.a. ZigBee): <250 kbit/s

- ► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s
- ► IEEE 802.11 (a.k.a. Wi-Fi): <50 Mbit/s (802.11ad goes up to 6.75 Gbit/s)
- ▶ IEEE 802.15.1 (a.k.a. Bluetooth): <1 Mbit/s
- ► IEEE 802.15.4 (a.k.a. ZigBee): <250 kbit/s
- ► IEEE 802.16 (a.k.a. Wi-Max): <40 Mbit/s

- ► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s
- ► IEEE 802.11 (a.k.a. Wi-Fi): <50 Mbit/s (802.11ad goes up to 6.75 Gbit/s)
- ▶ IEEE 802.15.1 (a.k.a. Bluetooth): <1 Mbit/s
- ► IEEE 802.15.4 (a.k.a. ZigBee): <250 kbit/s
- ► IEEE 802.16 (a.k.a. Wi-Max): <40 Mbit/s
- ▶ IEEE 1394 (a.k.a. Firewire): <3200 Mbit/s

- ► IEEE 802.3 (a.k.a. Ethernet): <100Gbit/s
- ► IEEE 802.11 (a.k.a. Wi-Fi): <50 Mbit/s (802.11ad goes up to 6.75 Gbit/s)
- ► IEEE 802.15.1 (a.k.a. Bluetooth): <1 Mbit/s
- ► IEEE 802.15.4 (a.k.a. ZigBee): <250 kbit/s
- ► IEEE 802.16 (a.k.a. Wi-Max): <40 Mbit/s
- ► IEEE 1394 (a.k.a. Firewire): <3200 Mbit/s
- ▶ USB, serial port such as RS-232...

## Presentation Outline

Introduction

Physical

Data Link

Network

**Transport** 

Interface transport layer,

- ► Interface transport layer,
- Host addressing,

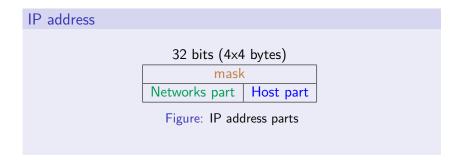

- Interface transport layer,
- Host addressing,
- End-to-end packet transmission (data link? Connectionless? Switch? Router?),

### Aims

- Interface transport layer,
- Host addressing,
- ► End-to-end packet transmission (data link? Connectionless? Switch? Router?),
- Routing, load balancing

### Concepts

- ▶ IP addressing fundamentals,
- Classfull IP addressing,
- Subnet and VLSM (Variable length subnet masks),
- CIDR (Classless inter-domain routing),
- Routing,
- ► IPv6.

#### Masks

Separates network and host bits,

#### Masks

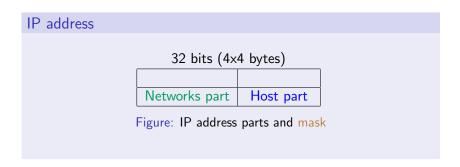

- Separates network and host bits,
- ► MSB **always** are ones and then zeros! 255.254.255.0 is not possible,

#### Masks

- Separates network and host bits,
- MSB always are ones and then zeros! 255.254.255.0 is not possible,
- Indicates how many bits are used for the network part:
  - ► A 8-bit mask leaves 24 bits for the hosts,
  - ► A 16-bit mask leaves 16 bits for the hosts,
  - ► A 24-bit mask leaves 8 bits for the hosts,
  - A N-bit mask leaves 32-N bits for the hosts.

#### Masks

- Separates network and host bits,
- MSB always are ones and then zeros! 255.254.255.0 is not possible,
- ▶ Indicates how many bits are used for the network part:
  - ► A 8-bit mask leaves 24 bits for the hosts,
  - A 16-bit mask leaves 16 bits for the hosts,
  - A 24-bit mask leaves 8 bits for the hosts,
  - ► A N-bit mask leaves 32-N bits for the hosts.
- Two different masks (differences seen further):
  - Network mask,
  - Subnet mask.

### 32 bits (4x4 bytes)

•	
ones mask	zeros mask
Networks part	Host part

Figure: IP address parts and mask

### Is that an address?

Network address,

#### Is that an address?

- ► Network address,
- ► Hosts,

#### Is that an address?

- Network address,
- ► Hosts,
- Broadcast address.

#### Is that an address?

- Network address,
- ► Hosts,
- Broadcast address.

#### Within the same network

► All addresses have the same network bits,

#### Is that an address?

- Network address,
- ► Hosts,
- Broadcast address.

#### Within the same network

- ▶ All addresses have the same network bits,
- ▶ Network address has zeros for host bits: x.x.x.0\*,

#### Is that an address?

- Network address,
- Hosts,
- Broadcast address.

#### Within the same network

- ▶ All addresses have the same network bits,
- ► Network address has zeros for host bits: x.x.x.0\*,
- ► All hosts have different host bits: x.x.x.[0-1]\*,

#### Is that an address?

- Network address,
- ► Hosts,
- Broadcast address.

#### Within the same network

- ▶ All addresses have the same network bits,
- ► Network address has zeros for host bits: x.x.x.0\*,
- ► All hosts have different host bits: x.x.x.[0-1]\*,
- ▶ Broadcast address has ones for host bits: xxxx.1\*.

Mask /24	255	255	255	0

Figure: IP address example 2

Formula: how many hosts with a N-bit mask?

$$2^{32-N}-2$$

Formula: how many hosts with a N-bit mask?

 $2^{32-N}-2$ , the -2 moves out network and broadcast addresses which are not hosts.

### Formula: how many hosts with a N-bit mask?

 $2^{32-N} - 2$ , the -2 moves out network and broadcast addresses which are not hosts.

▶ 24-bit mask:  $2^{32-24} - 2 = 2^8 - 2 = 254$  hosts

### Formula: how many hosts with a N-bit mask?

 $2^{32-N}-2$ , the -2 moves out network and broadcast addresses which are not hosts.

- ▶ 24-bit mask:  $2^{32-24} 2 = 2^8 2 = 254$  hosts
- ▶ 16-bit mask:  $2^{32-16} 2 = 2^{16} 2 = 65.534$  hosts

### Formula: how many hosts with a N-bit mask?

 $2^{32-N}-2$ , the -2 moves out network and broadcast addresses which are not hosts.

- ▶ 24-bit mask:  $2^{32-24} 2 = 2^8 2 = 254$  hosts
- ▶ 16-bit mask:  $2^{32-16} 2 = 2^{16} 2 = 65.534$  hosts
- ▶ 8-bit mask:  $2^{32-8} 2 = 2^{24} 2 = 16.777.214$  hosts

### Public addresses

► Most of IP addresses

#### Public addresses

- Most of IP addresses
- Registered ISP and large organizations inherit blocks of public addresses from IANA<sup>2</sup>

#### Public addresses

- Most of IP addresses
- Registered ISP and large organizations inherit blocks of public addresses from IANA<sup>2</sup>
- Usage of not registered public addresses is forbidden.

#### Private addresses

▶ Privates addresses are A, B and C classes (not all, see after)

#### Public addresses

- Most of IP addresses
- Registered ISP and large organizations inherit blocks of public addresses from IANA<sup>2</sup>
- ▶ Usage of not registered public addresses is forbidden.

#### Private addresses

- Privates addresses are A, B and C classes (not all, see after)
- No registration needed

#### Public addresses

- Most of IP addresses
- Registered ISP and large organizations inherit blocks of public addresses from IANA<sup>2</sup>
- Usage of not registered public addresses is forbidden.

#### Private addresses

- Privates addresses are A, B and C classes (not all, see after)
- No registration needed
- Not routed across the Internet

#### Public addresses

- Most of IP addresses
- Registered ISP and large organizations inherit blocks of public addresses from IANA<sup>2</sup>
- Usage of not registered public addresses is forbidden.

### Private addresses

- Privates addresses are A, B and C classes (not all, see after)
- No registration needed
- Not routed across the Internet
- ▶ Proxy, NAT and private addresses solved IPv4 shortage.

Class	А	В	С
First octet	1 - 126	128 - 191	192 - 223
First octet 0b	0*	10*	110*
Network mask	255.0.0.0	255.255.0.0	255.255.255.0
	/8	/16	/24
IP addresses range	1.0.0.0	128.0.0.0	192.0.0.0
	126.0.0.0	191.255.0.0	223.255.255.0
Private range	10.0.0.0	176.16.0.0	192.168.0.0
	10.255.255.255	176.31.255.255	192.168.255. <b>0</b>
Number of hosts	16.777.214	65.534	254

Figure: Three main classes

### Class D

► First octet: 224 - 239

### Class D

► First octet: 224 - 239

► First octet pattern: 1110\*

#### Class D

► First octet: 224 - 239

► First octet pattern: 1110\*

▶ Theses IP addresses are multicast addresses.

#### Class D

- ► First octet: 224 239
- ► First octet pattern: 1110\*
- ▶ Theses IP addresses are multicast addresses.

#### Class E

Everything left

#### Class D

- ► First octet: 224 239
- ► First octet pattern: 1110\*
- Theses IP addresses are multicast addresses.

#### Class E

- Everything left
- Experimental class.

#### Reserved addresses

▶ 0.0.0.0 used in routing (seen further)

#### Reserved addresses

- ▶ 0.0.0.0 used in routing (seen further)
- ► 127.0.0.0/8: loopback addresses (127.0.0.1 127.255.255.254).

► Class A (16 m-addresses) and B (65 k-adresses) are too large!

- ► Class A (16 m-addresses) and B (65 k-adresses) are too large!
- ► Class C (254 addresses) is manageable. A and B are not, and then not fully utilized... That's a waste of IP addresses!

- ▶ Class A (16 m-addresses) and B (65 k-adresses) are too large!
- ► Class C (254 addresses) is manageable. A and B are not, and then not fully utilized... That's a waste of IP addresses!

Means to limit the number of nodes on a network (regardless of the class) and, thus, improve the manageability, are needed. Three means for it:

Subnet.

- ▶ Class A (16 m-addresses) and B (65 k-adresses) are too large!
- ► Class C (254 addresses) is manageable. A and B are not, and then not fully utilized... That's a waste of IP addresses!

Means to limit the number of nodes on a network (regardless of the class) and, thus, improve the manageability, are needed. Three means for it:

- Subnet.
- VLSM (Variable Length Subnet Mask),

- ▶ Class A (16 m-addresses) and B (65 k-adresses) are too large!
- ► Class C (254 addresses) is manageable. A and B are not, and then not fully utilized... That's a waste of IP addresses!

Means to limit the number of nodes on a network (regardless of the class) and, thus, improve the manageability, are needed. Three means for it:

Classless Inter-domain Routing?

### Classless Inter-domain Routing?

Wait! What is routing?

Algorithm processed to decide where to forward a packet

#### Any router must

- know where any packet should be directed
- send directly the packets to the packet's destination if the router and the destination are on the same network

#### Any node

- on any network can communicate directly with all the nodes within the same network
- can connect to any node using its gateway
- needs to be aware of its gateway to communicate with nodes on other networks

#### Route

- Destination
- Gateway
- Masks
- Metric

#### Route

- Destination
- Gateway
- Masks
- Metric

```
>sudo route -n
Kernel IP routing table
                                                  Flags Metric Ref
Destination
                Gateway
                                 Genmask
                                                                       Use Iface
0.0.0.0
                192.168.0.254
                                 0.0.0.0
                                                                         0 eth0
                                                  UG
192.168.0.0
                0.0.0.0
                                 255.255.255.0
                                                                         0 eth0
```

Figure: Routing table

```
>sudo route -n
Kernel IP routing table
Destination Gateway Genmask Flags Metric Ref Use Iface
0.0.0.0 192.168.0.254 0.0.0.0 UG 0 0 0 eth0
192.168.0.0 0.0.0.0 255.255.255.0 U 0 0 0 eth0
```

Figure: Routing table

#### 0.0.0.0?

- Default address
- Default route
- ▶ Default gateway

#### Example

What would the routing table of this router will look like?

Static or dynamic?

Static or dynamic?

We will see this later

Combine 2+ networks' into one bigger to facilitate routing.

Combine 2+ networks' into one bigger to facilitate routing.

### Classless Inter-domain Routing?

▶ Does a routing table having both (192.168.0.0/24, E0), (192.168.1.0/24, E0), (10.0.0.0/8, S0) can be shorten?

Combine 2+ networks' into one bigger to facilitate routing.

#### Classless Inter-domain Routing?

- Does a routing table having both (192.168.0.0/24, E0), (192.168.1.0/24, E0), (10.0.0.0/8, S0) can be shorten?
- ► Does a routing table having both (192.168.0.0/24, E0), (192.168.1.0/24, E0), (192.168.8.0/24, E0), (10.0.0.0/8, S0) can be shorten?

Combine 2+ networks' into one bigger to facilitate routing.

#### Classless Inter-domain Routing?

- ▶ Does a routing table having both (192.168.0.0/24, E0), (192.168.1.0/24, E0), (10.0.0.0/8, S0) can be shorten?
- ► Does a routing table having both (192.168.0.0/24, E0), (192.168.1.0/24, E0), (192.168.8.0/24, E0), (10.0.0.0/8, S0) can be shorten?
- ► Does a routing table having both (192.168.0.0/24, E0), (192.168.4.0/24, E0), (192.168.1.0/24, E1), (10.0.0.0/8, S0) can be shorten?

#### RIP v1

Classful routing

#### RIP v1

- Classful routing
- ▶ Periodic updates (30 sec) ..

#### RIP v1

- Classful routing
- ▶ Periodic updates (30 sec) ..
- ▶ ..by broadcasting (!)

#### RIP<sub>v1</sub>

- Classful routing
- ▶ Periodic updates (30 sec) ..
- ..by broadcasting (!)
- Metric is hop-count (max = 15, infinite = 16)

#### RIP v1

- Classful routing
- ▶ Periodic updates (30 sec) ..
- ..by broadcasting (!)
- Metric is hop-count (max = 15, infinite = 16)
- ► Timer (180 sec) to tag route as invalid (metric = 16)

#### RIP v1

- Classful routing
- ▶ Periodic updates (30 sec) ..
- ..by broadcasting (!)
- ▶ Metric is hop-count (max = 15, infinite = 16)
- ► Timer (180 sec) to tag route as invalid (metric = 16)
- ▶ no subnet, no VLSM, no CIDR, no router authentication

### RIP v2

Classless routing

#### RIP<sub>v2</sub>

- Classless routing
- ► Multicast (224.0.0.9)

#### RIP<sub>v2</sub>

- Classless routing
- ► Multicast (224.0.0.9)
- VLSM support

#### RIP v2

- Classless routing
- Multicast (224.0.0.9)
- VLSM support
- Route summarization

#### RIP v2

- Classless routing
- Multicast (224.0.0.9)
- VLSM support
- Route summarization
- "Authentication" (MD5)

#### RIP v2

- Classless routing
- Multicast (224.0.0.9)
- VLSM support
- Route summarization
- "Authentication" (MD5)

RIPng is the next RIP version for support of IPv6

1. Router getting online broadcasts Request message

- 1. Router getting online broadcasts Request message
- 2. RIP Router send broadcasts Response message with their routing table

- 1. Router getting online broadcasts Request message
- RIP Router send broadcasts Response message with their routing table
- 3. When Update timers (from other routers) expire routing table<sup>3</sup> is sent again

- 1. Router getting online broadcasts Request message
- 2. RIP Router send broadcasts Response message with their routing table
- 3. When Update timers (from other routers) expire routing table<sup>3</sup> is sent again
- 4. When Invalid timer expires, the metric of the route is set to 16 (unreachable)

- 1. Router getting online broadcasts Request message
- RIP Router send broadcasts Response message with their routing table
- 3. When Update timers (from other routers) expire routing table<sup>3</sup> is sent again
- 4. When Invalid timer expires, the metric of the route is set to 16 (unreachable)
- 5. When Flush timer expires, the 16-metric routes are removed from the routing table

- 1. Router getting online broadcasts Request message
- 2. RIP Router send broadcasts Response message with their routing table
- When Update timers (from other routers) expire routing table<sup>3</sup> is sent again
- 4. When Invalid timer expires, the metric of the route is set to 16 (unreachable)
- 5. When Flush timer expires, the 16-metric routes are removed from the routing table
- 6. When a new router (or new metric) is sent, a Hold-down timer is started to stabilize the network.

<sup>&</sup>lt;sup>3</sup>not always all the routing table

- ► CIDR
- Build a topology of the network
- Dijkstra
- Metric = f(bandwidth, load, delay, reliability)
- Authentication support

► Support billions of hosts (even with inefficient IP addressing)

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster
- Better security

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster
- Better security
- Better real-time QoS

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster
- Better security
- Better real-time QoS
- Better multicast diffusion (scope)

### IPv6 - Aims

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster
- Better security
- Better real-time QoS
- ► Better multicast diffusion (scope)
- Being able to move, without changing IP address

### IPv6 - Aims

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster
- Better security
- Better real-time QoS
- Better multicast diffusion (scope)
- Being able to move, without changing IP address
- ► Make the protocol able to evolve

## IPv6 - Aims

- Support billions of hosts (even with inefficient IP addressing)
- Reduce routing table size
- Simplified protocol to allow routers to process packets faster
- Better security
- Better real-time QoS
- Better multicast diffusion (scope)
- Being able to move, without changing IP address
- Make the protocol able to evolve
- Make the protocol able to coexist with newer version

### TCP header

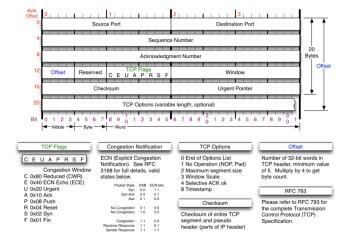

Figure: nmap.org: TCP header

## **UDP** header

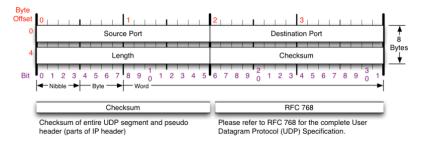

Figure: nmap.org: UDP header

# Socket Primitives (TCP)

Order	Primitive	Meaning
1	SOCKET	Creates a new communication endpoint
2	BIND	Links local IP address to the socket
3	LISTEN	Signs up for incoming connections
4	ACCEPT	Blocking call till a connection attempt occurs
-	CONNECT	Tries to connect to another communication endpoint
-	SEND	Sends data through the established connection
-	RECEIVE	Receives data through the established connection
last	CLOSE	Releases the connection

Figure: TCP primitives

A socket does not have an IP address until it is bound, just an allocation in the transport entity. A server must listen before any client is able to connect.

# What are theses?

- ► Frame: Physical layer representation
- ► **Datagram**: UDP<sup>5</sup> or IP packet (IP datagram, UDP datagram)
- ▶ **Segment**: TCP data unit
- ▶ **PDU**: Protocol Data Unit, generic term.
- ► Fragment: Any data unit fragmented

# Hope you liked it and learnt about networking!
